

1-The first step is to use the code {port = await navigator.serial.requestPort({}); await port.open({ baudRate:9600 })}; to select the user's serial port

2-A window will appear for the user to select the Arduino port

---

3-The user will speak and the speech will write a text area

4-After writing the text area code, the comparison will take place. If it contains the word right, a message will be sent to the arduino, the word right.
